FATAL WORK INJURIES IN MICHIGAN, 2000

Injuries sustained in transportation accidents resulted in the death of 50 Michigan workers in 2000. This represents 32 percent of the 156 workers fatally injured in Michigan in 2000. Highway accidents accounted for 24 fatalities or 15 percent of the total. Being struck by an object resulted in the death of 25 Michigan workers and 20 others were killed as the result of falls. Assaults and violent acts accounted for 26 deaths or 17 percent of the total. These findings are from the Census of Fatal Occupational Injuries conducted by the Michigan Department of Consumer & Industry Services, MIOSHA Information Division in cooperation with the Bureau of Labor Statistics (BLS) of the U.S. Department of Labor.

The Census of Fatal Occupational Injuries uses multiple sources to identify, verify, and profile work injuries that are fatal. Key information about each workplace fatality (such as occupation and other worker characteristics, equipment being used, and circumstances of the event) is obtained by cross-referencing a variety of source records. These records include death certificates, workers compensation records, and reports to federal and state agencies.

2000 CENSUS PROFILES

Major findings of the Michigan Census are:

- * Transportation accidents led all other events and accounted for 32 percent of the 156 fatal occupational injuries in 2000. This was followed by Contact with Objects and Equipment at 24 percent and Assaults and Violent Acts with 17 percent. (Table 1)
- * Sixty two percent of the fatally injured Michigan workers were 25 54 years of age.
- * Eight percent of Michigan's fatally injured workers were women.
- * Occupations with the largest number of worker fatalities were Transportation and Material Moving Operations, and Construction trades.
- * Industry groups with the largest number of Michigan fatal work injuries in 2000 were Construction (29), Manufacturing (25), and Services (22). (Table 4.)

BACKGROUND - CENSUS OF FATAL OCCUPATIONAL INJURY PROGRAM

The Census of Fatal Occupational Injuries program, part of the BLS safety and health statistics program, provides the most complete count of fatal work injuries available. The program uses diverse state and federal data sources to identify, verify and profile fatal work injuries. Information about each workplace fatality (occupation and other worker characteristics, equipment being used, and circumstances of the event) is obtained by cross-referencing source documents, such as death certificates, workers' compensation records, and reports to federal

and state agencies. This method assures counts are as complete and accurate as possible. This is the ninth year that the fatality census has been conducted in all 50 states and the District of Columbia.

Table 1. Number and Percent Distribution of Fatal Occupational Injuries by Event or Exposure, Michigan, 2000

__

| 1/ | Fat | alities |

TECHNICAL NOTES

Definitions

For a fatality to be included in the census, the decedent must have been employed (that is working for pay, compensation, or profit) at the time of the event, engaged in legal work activity or present at the site of the incident as a requirement of his or her job. These criteria are generally broader than the criteria used by Federal and State agencies administering specific laws and regulations. (Fatalities that occur during a person's commute to and from work are excluded from the census counts)

Data presented in this release include deaths occurring in 2000 that resulted from traumatic occupational injuries. An injury is defined as an intentional or unintentional wound or damage to the body resulting from acute exposure to energy, such as heat, electricity or kinetic energy from a crash, or from the absence of such essentials as heat or oxygen caused by a specific event,

incident, or series of events within a single workday or shift. Included are open wounds, intracranial and internal injuries, heatstroke, hypothermia, asphyxiation, acute poisonings resulting from short-term exposures limited to the worker's shift, suicides and homicides, and work injuries listed as underlying or contributory causes of death.

Information on work-related fatal illnesses are not reported in the BLS census and are excluded from the attached tables because the latency period of many occupational illnesses and the difficulty of linking illnesses to work make identification of a universe problematic.

Measurement Techniques and Limitations

Data for the Census of Fatal Occupational Injuries are compiled from various state, federal and local administrative sources--including death certificates, workers' compensation reports and claims, reports to various regulatory agencies, medical examiner reports and police reports--as well as news and other non-governmental reports. Diverse sources are used because studies have shown that no single source captures all job-related fatalities. Source documents are matched so that each fatality is counted only once. To ensure that a fatality occurred while the decedent was at work, information is verified from two or more independent source documents, or from a source document and a follow-up questionnaire. Approximately 30 data elements are collected, coded, and tabulated, including information about the worker, the fatal incident, and the machinery or equipment involved.

Federal/State Agency Coverage

The Census of Fatal Occupational Injuries includes data for all fatal work injuries, whether they are covered by the Michigan Occupational Safety and Health Administration (MIOSHA) or other federal or state agencies or are outside the scope of regulatory coverage. Thus, any comparison between the BLS fatality census counts and those released by other agencies should take into account the different coverage requirements and definitions being used.

Several Federal and State agencies have jurisdiction over workplace safety and health. The Occupational Safety and Health Administration (OSHA) and affiliated agencies in States such as Michigan with OSHA approved safety programs cover the largest portion of the nations workers. However, injuries and illnesses occurring in certain industries or activities, such as coal, metal, and nonmetal mining and highway, water, rail, and air transportation, are excluded from MIOSHA coverage because they are covered by other federal agencies, such as the Mine Safety and Health Administration, and various agencies within the Department of Transportation.

Fatalities occurring in activities regulated by federal agencies other than MIOSHA are included in the count of fatal work injuries for Michigan in 2000.

Fatalities occurring among several other groups of workers are generally not covered by any federal or state agencies. These groups include self-employed and unpaid family workers, which accounted for about 13 percent of the fatalities.

Acknowledgments: We appreciate the effort of all agencies that submitted source documents used to achieve the objectives of this program. To collect and publish data on fatal work injuries that is timely, accurate, comprehensive, and useful for injury prevention.

Among these agencies are the Occupational Safety and Health Administration; National Institute for Occupational Safety and Health; the Center for Disease Control and Prevention; the Mine Safety and Health Administration; the U. S. Coast Guard; the Employment Standards Administration (Federal Employees' Compensation and Longshore and Harbor Workers' divisions); the National Transportation Safety Board; the Department of Energy; the National Association of Chiefs of Police; the Michigan vital statistics registrars, coroners, and medical examiners; the Michigan Bureau of Workers Disability Compensation; the Michigan Department of Community Health, State Registrar and Division of Health Statistics; the Michigan State Police Office of Highway and Safety Planning; Local Police Departments; and the state farm bureaus.
